

G2: WHAT IS DESIGN THINKING?

Design Thinking is a process which we define the problem being faced by the user and solving it by doing different strategies and methods in order to solve that problem. The Design Thinking has five different phases which are the following:

- Empathise
- Define
- Ideate
- Prototype
- Test

These phase doesn't follow any specific order and can often occur in random or iteratively. Meaning, these phases are just guidelines for us which we follow in order to solve the problem. Based on my understanding, Design Thinking is our own style meaning that we choose the solution based on our own which are influenced by the user and your own knowledge. Every person has its own unique style, which makes solution different from other person. Also, as part of the Design Thinking, we should always consider the user and think for a solution outside the box, there are many solutions available in a problem so don't limit yourself.
