R3: NEED FINDING (DESIGN PROBLEM)

Group work, what students love the most and some individual work but it is more fun doing an activity if you're with your friends and classmates. When Ms. Jen told us that we will have groupings and there are respective leaders for each group that will choose their members, it's the most exciting part because you won't know who'll pick you and of course you're sure that one of your leader friends will pick you and the sad part about that is your friends are the different leaders from each group which you won't be grouped together. Yuca picked me first because we're very close even though we just met last year and I know that she's a responsible and reliable leader. And for our third member, it's Christian Gloria which is not really my friend or we're just classmates but I know he's responsible too like Yuca.

For our first discussion, we had brainstorming on what topics are we gonna focus and there are different suggestions but we came up about Mental Health because it is prevalent or timely nowadays especially in teenagers. It's a very sensitive topic because words are powerful and you should be more careful when dealing with mental health so Yuca said that she'll interview one of her friends which is very knowledgeable about that in order for us to have the grasp on what will we focus on.

On the first presentation, we're not really sure if what we did was correct because it's a bit complicated especially in the storyboard and persona part. Our design statement was wrong because it's in bullet form so we need to choose one specific topic we focus and the idea we came up was focusing on establishing connection between individuals using a website application.

For the last presentation, it's really stressful since it's the midterm week and we have to review for our other subject so we schedule an online meeting (MS Teams) so that we can divide the work efficiently. The presentation was all good except for the prototype which is already explained and solved and we're currently working for our prototype and all I can say that the feedback after every presentation from different group was very effective, rather than having a feedback by one person. Now we're working towards the final output, and we're starting to visualize what it will look like and we're dedicated to finish it and present our final output.
